## Figures and figure supplements

Noise-induced plasticity of KCNQ2/3 and HCN channels underlies vulnerability and resilience to tinnitus

**Shuang Li, et al.**

**Figure 1.** Mouse model of tinnitus allows for behavioral separation of noise-exposed mice with either vulnerability or resilience to tinnitus. **A.** Top left: diagram illustrating gap and no-gap trials in the gap detection behavioral assay. Top right: representative startle responses in no-gap (always in gray) and gap trials from control (black), tinnitus (green), and non-tinnitus (blue) mice. AU: Arbitrary unit. Bottom left: diagram illustrating startle-only and prepulse trials in the prepulse inhibition (PPI) behavioral assay. Bottom right: representative startle responses in startle-only (always in gray) and prepulse trials from control (black), tinnitus (green), and non-tinnitus (blue) mice. **B.** Summary graphs of gap startle ratio (response to gap trial/response to no-gap trial) before (open bar) and 1 week after noise exposure (filled bar) for high- and low-frequency background sounds (high-frequency background, 20–32 kHz, control:  $n = 21$ ,  $p = 0.6$ ; tinnitus:  $n = 11$ ,  $p < 0.001$ ; non-tinnitus:  $n = 10$ ,  $p = 0.6$ ; low frequency background, 10–16 kHz, control:  $n = 21$ ,  $p = 0.42$ ; tinnitus:  $n = 11$ ,  $p = 0.06$ ; non-tinnitus:  $n = 10$ ,  $p = 0.07$ ). **C.** Summary graphs of prepulse inhibition ratio (PPI ratio, response to prepulse trial/response to startle-only trial) before (open bar) and 1 week after noise exposure (filled bar) for high- and low-frequency prepulse (high-frequency background, 20–32 kHz, control:  $n = 21$ ,  $p = 0.25$ ; tinnitus:  $n = 11$ ,  $p = 0.18$ ; non-tinnitus:  $n = 10$ ,  $p = 0.36$ ; low frequency background, 10–16 kHz, control:  $n = 22$ ,  $p = 0.56$ ; tinnitus:  $n = 11$ ,  $p = 0.17$ ; non-tinnitus:  $n = 10$ ,  $p = 0.56$ ). Asterisk,  $p < 0.05$ . Error bars indicate SEM. See end of the manuscript for detailed values in **B** and **C**. DOI: [10.7554/eLife.07242.003](https://doi.org/10.7554/eLife.07242.003)

**Figure 1—figure supplement 1.** Tinnitus behavior (gap detection deficit) is detected with high-frequency background sounds. **A.** Probability distribution of changes in gap startle ratio ( $\Delta$  gap startle ratio) in sham-exposed (control) mice.  $\Delta$  gap startle ratio represents changes in control mice between postnatal day P17- P20 and P24 - P27. Data were fitted by a normal distribution (red curve,  $\mu = -0.02$ ,  $\delta = 0.15$ ,  $n = 21$ ).  $\Delta$  gap startle ratios smaller than 0.28 (dotted line), which is the point that is 2 standard deviations above the mean and is used as the threshold for evaluating tinnitus, represent 98.6% of the experimental  $\Delta$  gap startle ratios and 98.5% of the fitted distribution. **B.** Summary graph of gap startle ratio for different frequencies of background for control mice: 10 kHz, before:  $0.69 \pm 0.03$ ,  $n = 13$ , after:  $0.79 \pm 0.04$ ,  $n = 17$ ,  $p = 0.08$ ; 12 kHz, before:  $0.65 \pm 0.04$ ,  $n = 8$ , after:  $0.70 \pm 0.04$ ,  $n = 18$ ,  $p = 0.47$ ; 16 kHz, before:  $0.67 \pm 0.03$ ,  $n = 15$ , after:  $0.66 \pm 0.03$ ,  $n = 18$ ,  $p = 0.67$ ; 20 kHz, before:  $0.64 \pm 0.02$ ,  $n = 14$ , after:  $0.67 \pm 0.03$ ,  $n = 18$ ,  $p = 0.47$ ; 24 kHz, before:  $0.74 \pm 0.02$ ,  $n = 17$ , after:  $0.69 \pm 0.05$ ,  $n = 14$ ,  $p = 0.34$ ; 32 kHz, before:  $0.71 \pm 0.03$ ,  $n = 19$ , after:  $0.69 \pm 0.05$ ,  $n = 16$ ,  $p = 0.77$ . **C.** Summary graph of gap startle ratio for different frequencies of background for tinnitus mice: 10 kHz, before:  $0.65 \pm 0.04$ ,  $n = 8$ , after:  $0.70 \pm 0.04$ ,  $n = 10$ ,  $p = 0.36$ ; 12 kHz, before:  $0.61 \pm 0.06$ ,  $n = 5$ , after:  $0.71 \pm 0.03$ ,  $n = 10$ ,  $p = 0.10$ ; 16 kHz, before:  $0.66 \pm 0.05$ ,  $n = 8$ , after:  $0.74 \pm 0.06$ ,  $n = 10$ ,  $p = 0.30$ ; 20 kHz, before:  $0.62 \pm 0.06$ ,  $n = 7$ , after:  $0.80 \pm 0.05$ ,  $n = 11$ ,  $p = 0.04$ ; 24 kHz, before:  $0.68 \pm 0.02$ ,  $n = 7$ , after:  $0.86 \pm 0.05$ ,  $n = 9$ ,  $p = 0.006$ ; 32 kHz, before:  $0.59 \pm 0.03$ ,  $n = 8$ , after:  $0.86 \pm 0.03$ ,  $n = 12$ ,  $p < 0.0001$ . **D.** Summary graph of gap startle ratio for different frequencies of background for non-tinnitus mice: 10 kHz, before:  $0.69 \pm 0.05$ ,  $n = 7$ , after:  $0.61 \pm 0.07$ ,  $n = 10$ ,  $p = 0.40$ ; 12 kHz, before:  $0.78 \pm 0.03$ ,  $n = 6$ , after:  $0.58 \pm 0.06$ ,  $n = 8$ ,  $p = 0.02$ ; 16 kHz, before:  $0.71 \pm 0.04$ ,  $n = 6$ , after:  $0.72 \pm 0.04$ ,  $n = 9$ ,  $p = 0.83$ ; 20 kHz, before:  $0.73 \pm 0.05$ ,  $n = 6$ , after:  $0.64 \pm 0.06$ ,  $n = 9$ ,  $p = 0.32$ ; 24 kHz, before:  $0.66 \pm 0.04$ ,  $n = 7$ , after:  $0.70 \pm 0.07$ ,  $n = 9$ ,  $p = 0.67$ ; 32 kHz, before:  $0.71 \pm 0.03$ ,  $n = 7$ , after:  $0.78 \pm 0.05$ ,  $n = 6$ ,  $p = 0.26$ . **E.** Summary graph of PPI ratio for different frequencies of background sound for control mice: 10 kHz, before:  $0.61 \pm 0.02$ ,  $n = 21$ , after:  $0.58 \pm 0.02$ ,  $n = 21$ ,  $p = 0.24$ ; 12 kHz, before:  $0.66 \pm 0.03$ ,  $n = 21$ , after:  $0.62 \pm 0.02$ ,  $n = 21$ ,  $p = 0.34$ ; 16 kHz, before:  $0.61 \pm 0.04$ ,  $n = 21$ , after:  $0.68 \pm 0.03$ ,  $n = 19$ ,  $p = 0.21$ ; 20 kHz, before:  $0.69 \pm 0.02$ ,  $n = 20$ , after:  $0.69 \pm 0.02$ ,  $n = 20$ ,  $p = 0.99$ . **F.** Summary graph of PPI ratio for different frequencies of background sound for tinnitus mice: 10 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ ; 12 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ ; 16 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ ; 20 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ ; 24 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ ; 32 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ . **G.** Summary graph of PPI ratio for different frequencies of background sound for non-tinnitus mice: 10 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ ; 12 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ ; 16 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ ; 20 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ ; 24 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ ; 32 kHz, before:  $0.55 \pm 0.04$ ,  $n = 10$ , after:  $0.55 \pm 0.04$ ,  $n = 10$ ,  $p = 0.99$ . Figure 1—figure supplement 1. continued on next page

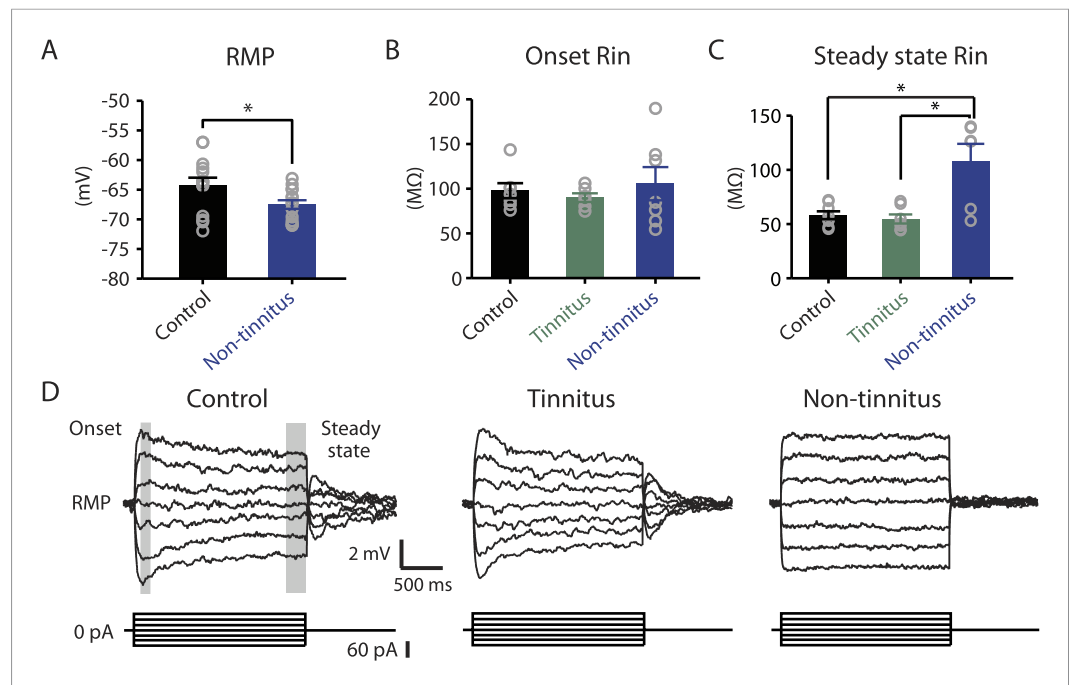

**Figure 2.** Tinnitus and non-tinnitus mice show similar ABR thresholds and suprathreshold ABR wave I amplitudes. **A.** Representative raw traces of auditory brainstem response (ABR) in response to click tone presented at different intensities (dB). I–V represent the different waves of the ABR. **B.** Summary graph of ABR thresholds for tinnitus (green) and non-tinnitus (blue) mice before (solid line) and 7 days (dashed line) after noise exposure ( $n = 5–11$ , no statistical difference was observed between tinnitus and non-tinnitus mice). **C.** Summary graph of suprathreshold wave I amplitudes for tinnitus (green) and non-tinnitus (blue) mice before noise exposure for high frequency (20–32 kHz) sound stimulation ( $n = 12–25$ , no statistical difference was observed between tinnitus and non-tinnitus mice). **D.** Summary graph of suprathreshold wave I amplitudes for tinnitus (green) and non-tinnitus (blue) mice 7 days after noise exposure for high frequency (20–32 kHz) sound stimulation ( $n = 4–10$ , no statistical difference was observed between tinnitus and non-tinnitus mice). See end of the manuscript for detailed values for **B–D**. Error bars indicate SEM.

DOI: [10.7554/eLife.07242.005](https://doi.org/10.7554/eLife.07242.005)

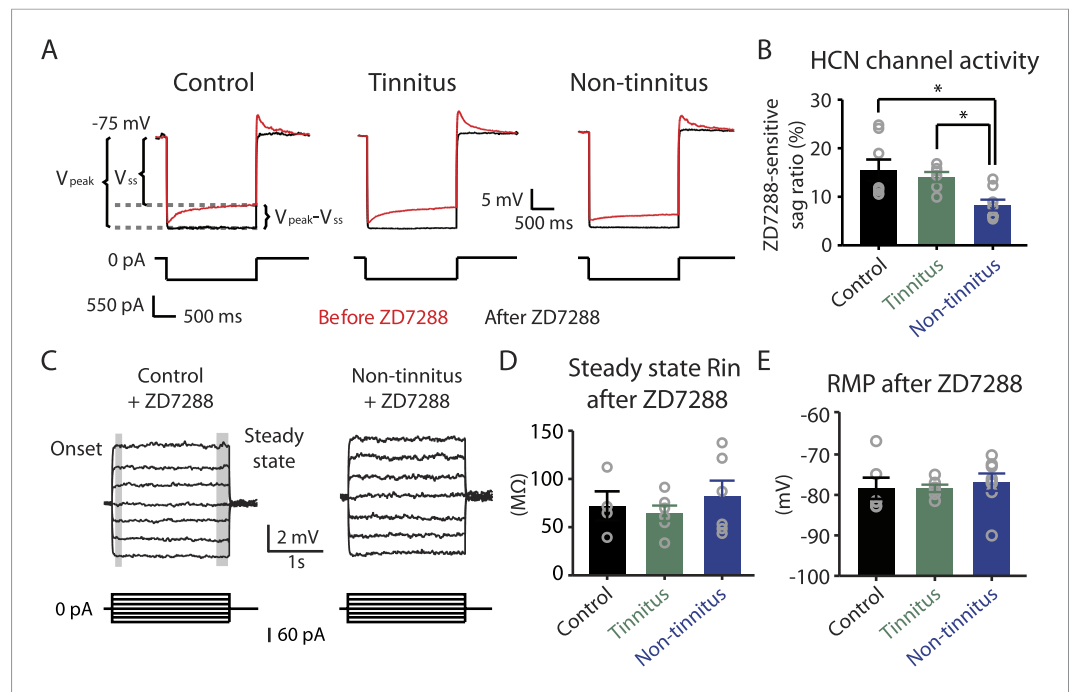

**Figure 3.** Noise-exposed mice show reduced KCNQ2/3 channel activity 4 days after noise exposure; this reduction is due to a depolarizing shift of  $V_{1/2}$ . **A.** Representative traces illustrating XE991 (10  $\mu$ M)-sensitive KCNQ2/3 currents (Top) in fusiform cells from a 4 days sham-exposed (black) and a 4 days noise-exposed (yellow) mouse in response to a voltage step to  $-50$  mV from a holding potential of  $-30$  mV (Bottom; for clearer representation, currents were truncated along time axis). **B.** Summary graph showing KCNQ2/3 current amplitude in fusiform cells from 4 days sham-exposed and 4 days noise-exposed mice (4 days sham-exposed mice,  $73.8 \pm 9.05$  pA,  $n = 6$ ; 4 days noise-exposed mice,  $39.16 \pm 6.7$  pA,  $n = 15$ ,  $p = 0.01$ ). **C.** Representative conductance–voltage relationship of XE991-sensitive current in 4 days sham-exposed (dark gray) and 4 days noise-exposed mice (light gray). Gray and red lines represent Boltzmann fits. **D.** Summary graph for Boltzmann fit parameter  $V_{1/2}$  (4 days sham-exposed:  $-28.3 \pm 1.9$  mV,  $n = 5$ , 4 days noise-exposed:  $-20.3 \pm 2.0$  mV,  $n = 4$ ,  $p = 0.03$ ). **E.** Summary graph for Boltzmann fit parameter  $G_{max}$  (4 days sham-exposed:  $39.1 \pm 10.2$  nS,  $n = 5$ , 4 days noise-exposed:  $37.7 \pm 20.2$  nS,  $n = 4$ ,  $p = 0.90$ ). **F.** Effect of retigabine injection 4–6 days after noise exposure on the percentage of mice that develop tinnitus. (Noise-exposed mice + saline at day 4–6: 57.1%,  $n = 14$ , noise-exposed mice + retigabine at day 4–6: 31.3%,  $n = 16$ ,  $p = 0.03$ ). Asterisk,  $p < 0.05$ . Error bars indicate SEM.

DOI: [10.7554/eLife.07242.006](https://doi.org/10.7554/eLife.07242.006)

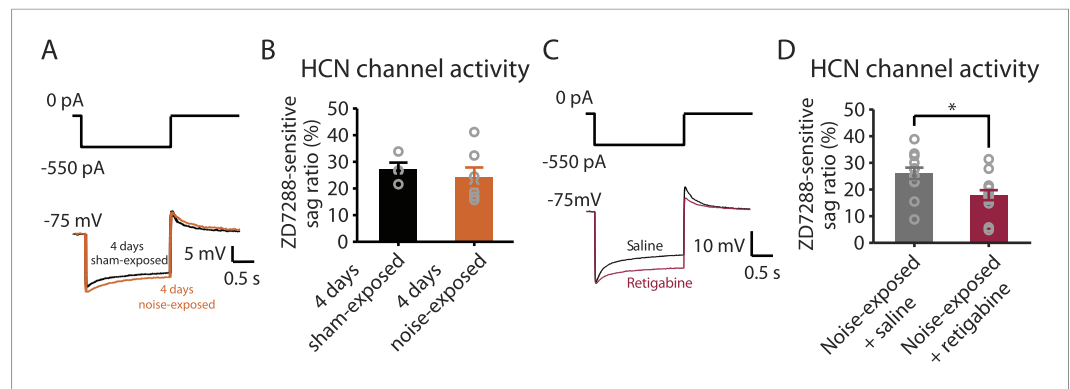

**Figure 4.** Non-tinnitus mice are biophysically distinct from control mice. **A.** Summary graph of resting membrane potential (RMP) of fusiform cells from control and non-tinnitus mice after blocking spontaneous firing with 0.5  $\mu$ M TTX (control:  $-64.2 \pm 1.3$  mV,  $n = 14$ ; non-tinnitus:  $-67.5 \pm 0.7$  mV,  $n = 15$ ,  $p = 0.04$ ). **B.** Summary graph of onset input resistance ( $R_{in}$ ) of fusiform cells as measured in **D** from control, tinnitus and non-tinnitus mice (control:  $97.9 \pm 8.4$  M $\Omega$ ,  $n = 8$ ; tinnitus:  $90.1 \pm 4.8$  M $\Omega$ ,  $n = 7$ ; non-tinnitus:  $105.7 \pm 18.5$  M $\Omega$ ,  $n = 7$ ,  $p = 0.73$ ). **C.** Summary graph of steady-state  $R_{in}$  of fusiform cells as measured in **D** from control, tinnitus, and non-tinnitus mice (control:  $58.2 \pm 3.6$  M $\Omega$ ,  $n = 8$ ; tinnitus:  $54.8 \pm 4.2$  M $\Omega$ ,  $n = 7$ ; non-tinnitus:  $108.18 \pm 15.9$  M $\Omega$ ,  $n = 7$ ,  $p = 0.04$ ). **D.** Representative voltage traces of fusiform cells from control, tinnitus, and non-tinnitus mice (Top) in response to small depolarizing and hyperpolarizing current steps (Bottom, -60 pA–60 pA, 20 pA step) for measuring input resistance. Shaded areas indicate the region for evaluating onset (starting from the peak of the voltage response, 100 ms width) and steady-state  $R_{in}$  (starting at the voltage response 1.75 s after the current injection, 250 ms width). Asterisk,  $p < 0.05$ . Error bars indicate SEM.

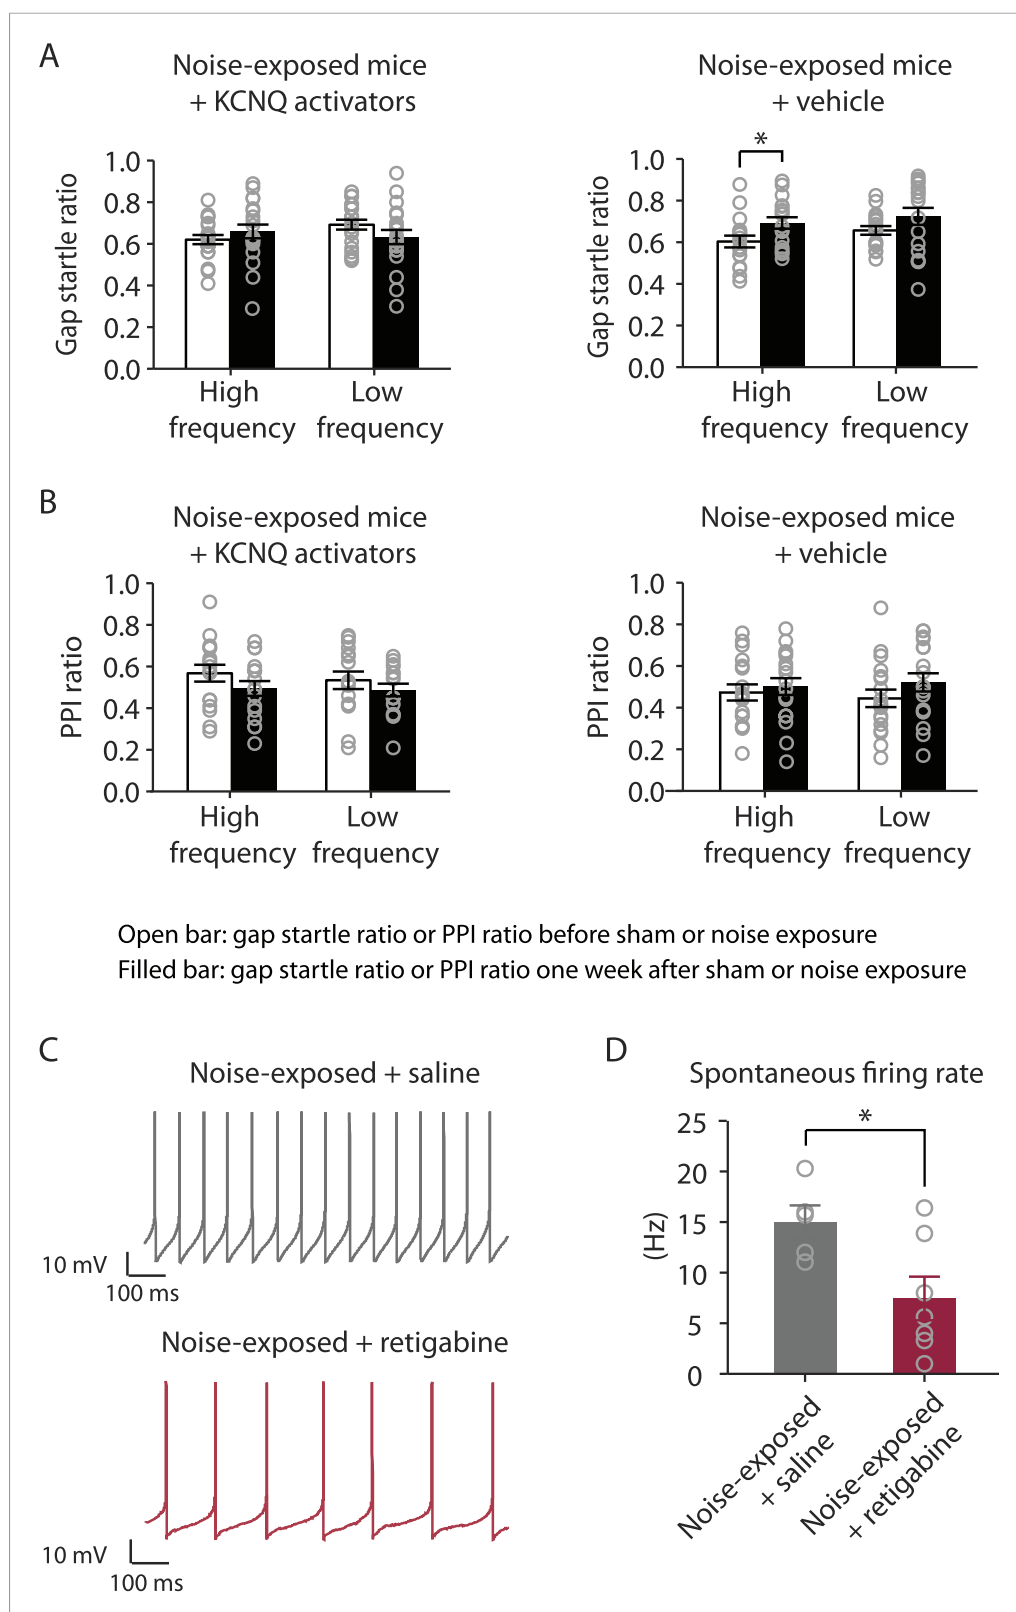

**Figure 6.** Noise-induced HCN plasticity occurs after KCNQ2/3 plasticity; KCNQ2/3 enhancement promotes HCN channel activity reduction. **A.** Representative voltage traces (Bottom) from fusiform cells in response to hyperpolarizing current step (Top) for measuring HCN channel activity in 4 days sham-exposed (black) and 4 days noise-exposed mice (yellow). **B.** Summary graph showing HCN channel activity in fusiform cells from 4 days sham-exposed and 4 days noise-exposed mice, measured as in **Figure 5A,B** (4 days sham-exposed mice,  $27.2 \pm 2.5\%$ ,  $n = 4$ ; 4 days noise-exposed mice,  $24.4 \pm 3.5\%$ ,  $n = 7$ ,  $p = 0.7$ ). **C.** Representative voltage traces (Bottom) from fusiform cells in response to hyperpolarizing current step (top) for measuring HCN channel activity in noise-exposed with saline injection (black) and noise-exposed mice with retigabine injection (red). **D.** Summary graph showing HCN channel activity, as measured as in **Figure 5A,B**. (Noise-exposed and saline-injected mice,  $26.1 \pm 0.6\%$ ,  $n = 13$ ; noise-exposed retigabine-injected,  $17.9 \pm 0.5\%$ ,  $n = 14$ ,  $p = 0.008$ ). Asterisk,  $p < 0.05$ . Error bars indicate SEM. DOI: 10.7554/eLife.07242.009

**Figure 7.** Injection of KCNQ activators after noise exposure reduces the incidence of tinnitus development without affecting threshold and suprathreshold ABRs. **A.** Percentage of mice that develop tinnitus (noise-exposed mice with intraperitoneal (IP) injection of vehicle, 50%,  $n = 18$ , noise-exposed mice with IP injection KCNQ channel activators, 25%,  $n = 20$ ,  $p = 0.02$ ). For noise-exposed mice with IP injection of vehicle (11 for retigabine vehicle and 7 flupirtine vehicle at 10 mg/kg); for noise-exposed mice with IP injection of KCNQ channel activators (10 for retigabine and 10 for flupirtine at 10 mg/kg). **B.** Summary graph of ABR thresholds from saline- (gray) and retigabine-injected (red) mice before (solid line) and 7 days after (dashed line) noise exposure and injection ( $n = 4-9$ , no statistical difference was observed between retigabine- and saline-injected mice). **C.** Summary graph of suprathreshold wave I amplitudes for noise-exposed mice + saline (gray) and noise-exposed mice + retigabine (red) before noise exposure for high frequency (20–32 kHz) sound stimulation ( $n = 5-15$ , no statistical difference was observed between retigabine- and saline-injected mice). **D.** Summary graph of suprathreshold wave I amplitudes for noise-exposed mice + saline (gray) and noise-exposed mice + retigabine (red) after noise exposure and injection for high-frequency (20–32 kHz) sound stimulation ( $n = 5-20$ , no statistical difference was observed between retigabine- and saline-injected mice). See end of the manuscript for detailed values for **B-D**. Asterisk,  $p < 0.05$ . Error bars indicate SEM. DOI: 10.7554/eLife.07242.010

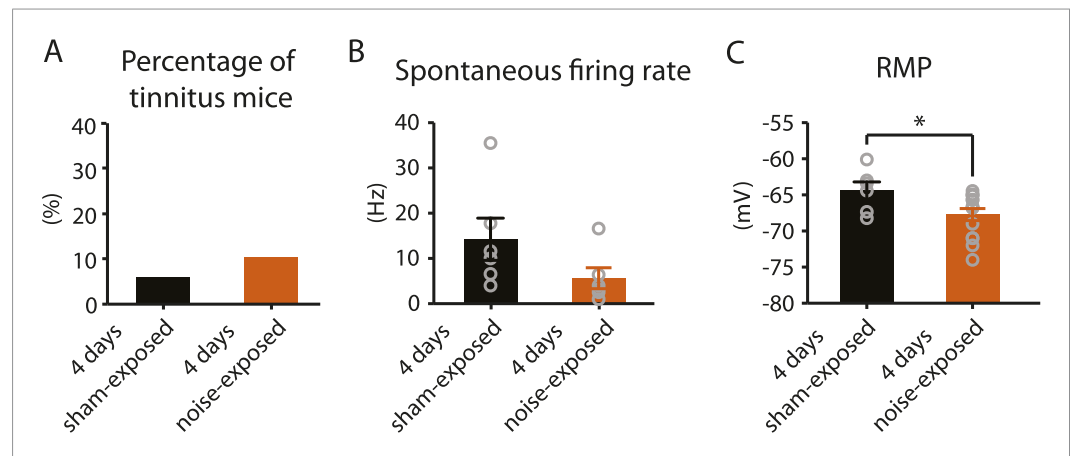

**Figure 7—figure supplement 1.** In vivo administration of KCNQ channel activators prevents the development of tinnitus and reduces the spontaneous firing rate of fusiform cells. **A.** Gap startle ratio of noise-exposed mice with Figure 7—figure supplement 1. continued on next page

Figure 7—figure supplement 1. Continued

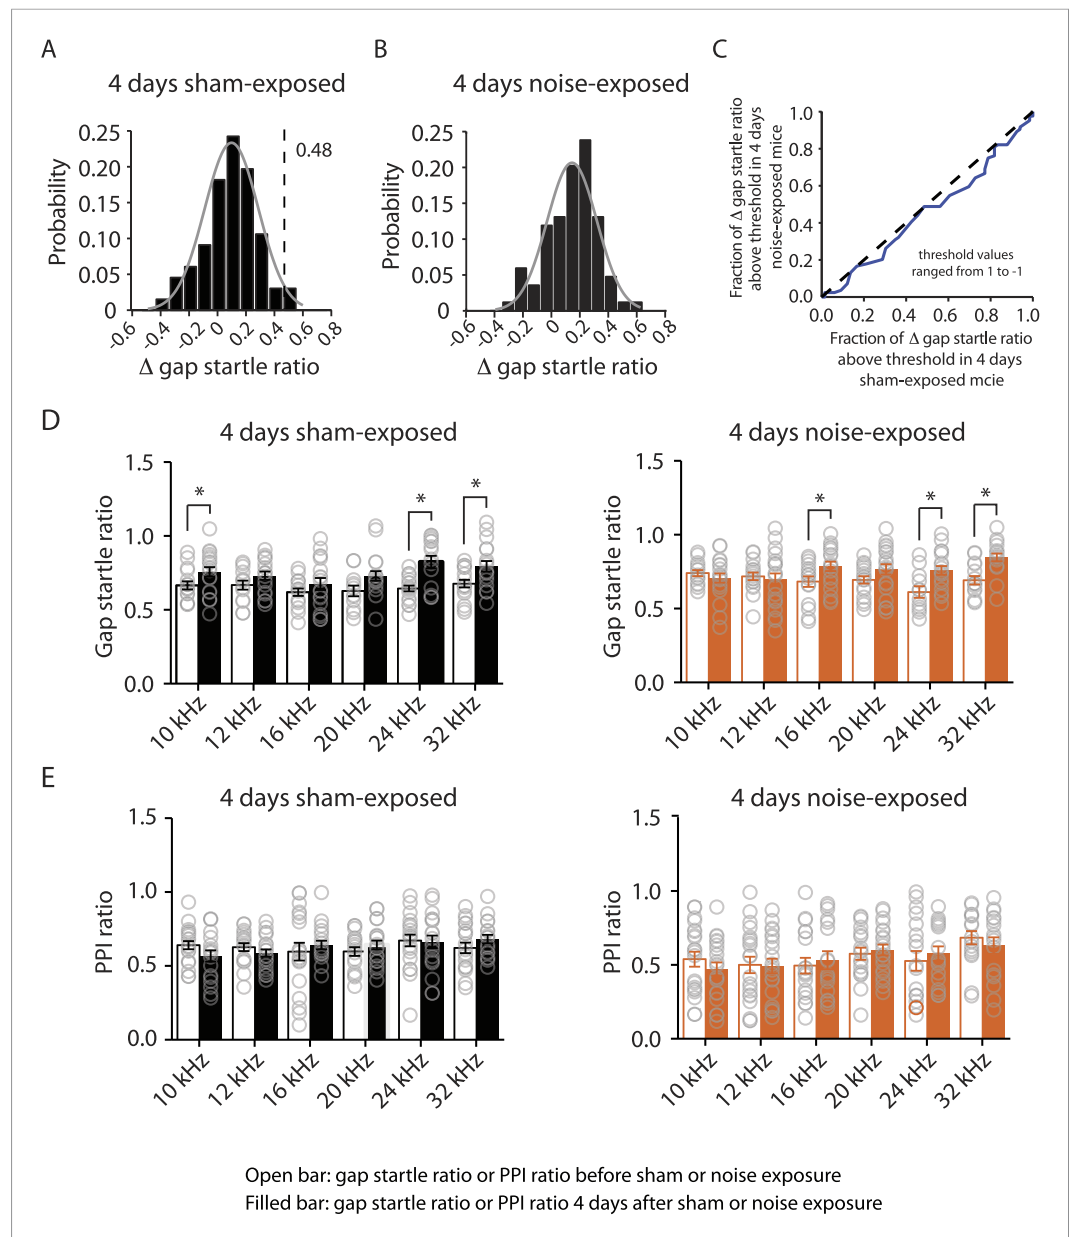

KCNQ channel activator injection (high frequency background sound: before,  $0.62 \pm 0.02$ , after,  $0.68 \pm 0.02$ ,  $n = 20$ ,  $p = 0.06$ ; low frequency background sound: before,  $0.70 \pm 0.02$ , after,  $0.63 \pm 0.03$ ,  $n = 20$ ,  $p = 0.06$ ) and with vehicle injection (high frequency background sound: before,  $0.61 \pm 0.02$ , after,  $0.70 \pm 0.03$ ,  $n = 18$ ,  $p = 0.01$ ; low frequency background sound: before,  $0.66 \pm 0.02$ , after,  $0.72 \pm 0.03$ ,  $n = 18$ ,  $p = 0.08$ ). **B.** PPI ratio of noise-exposed mice with KCNQ channel activator injection (high frequency background sound: before,  $0.56 \pm 0.03$ , after,  $0.49 \pm 0.03$ ,  $n = 20$ ,  $p = 0.12$ ; low frequency background sound: before,  $0.54 \pm 0.03$ , after,  $0.48 \pm 0.02$ ,  $n = 20$ ,  $p = 0.16$ ) and with vehicle injection (high frequency background sound: before,  $0.47 \pm 0.03$ , after,  $0.51 \pm 0.03$ ,  $n = 18$ ,  $p = 0.11$ ; low frequency background sound: before,  $0.44 \pm 0.04$ , after,  $0.52 \pm 0.03$ ,  $n = 18$ ,  $p = 0.36$ ). **C.** Representative spontaneous action potentials of fusiform cells from noise-exposed mice injected with either saline (Upper trace, gray) or retigabine (Lower trace, red) twice a day for 6 days. **D.** Summary graph showing spontaneous firing rate of fusiform cells from noise-exposed mice injected with either saline or retigabine twice a day for 6 days (noise-exposed mice with saline:  $15.0 \pm 1.5$  Hz,  $n = 5$ ; noise-exposed mice with activator:  $7.5 \pm 2.2$  Hz,  $n = 7$ ,  $p = 0.02$ ). Whole-cell voltage-follower mode recordings (current clamp, at  $I = 0$ ) were performed 7 days after noise exposure and in the presence of excitatory and inhibitory receptor antagonists ( $20 \mu\text{M}$  DNQX,  $20 \mu\text{M}$  SR95531, and  $0.5 \mu\text{M}$  strychnine). Asterisk,  $p < 0.05$ . Error bars indicate SEM.

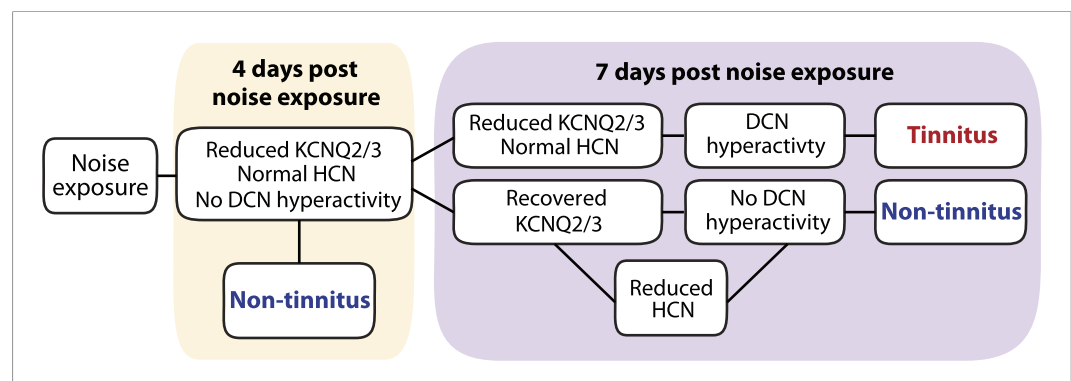

**Figure 8—figure supplement 1.** 4 days noise-exposed mice exhibit similar gap detection and PPI compared to 4 days sham-exposed mice. **A.** Probability distribution of changes in gap startle ratio ( $\Delta$  gap startle ratio) before and 4 days after sham exposure. The distribution of  $\Delta$  gap startle ratio represents the changes in gap startle ratios in control (sham-exposed) mice between postnatal P20 - P23 and P24 - P27. Data were fitted by a normal distribution (gray curve,  $\mu = 0.09$ ,  $\delta = 0.18$ ,  $n = 15$ ).  $\Delta$  gap startle ratios smaller than 0.48 (dotted line, which is the point that is 2 standard deviations above the mean and used as the threshold for evaluating tinnitus) represent 98.5% of the experimental population and 98.5% of the fitted distribution. **B.** Probability distribution of  $\Delta$  gap startle ratio before and 4 days after noise exposure. Data were fitted by a normal distribution (gray curve,  $\mu = 0.07$ ,  $\delta = 0.12$ ,  $n = 15$ ). **C.** Comparison of  $\Delta$  gap startle ratio distribution between 4 days sham-exposed and 4 days noise-exposed mice shown in A and B for different thresholds. With the threshold ranging from 1 to -1 in 0.02 increments, the fraction of  $\Delta$  gap startle ratios above threshold in 4 days noise-exposed mice was plotted against the fraction of  $\Delta$  gap startle ratios above threshold in 4 days sham-exposed mice. Because this relationship was not different from the diagonal line (dotted line), we concluded that the fractions of  $\Delta$  gap startle ratios above threshold in 4 days noise-exposed mice and 4 days sham-exposed mice were not different. **D.** Summary graph of gap startle ratio for different frequencies of background sound for 4 days sham-exposed mice (10 kHz, before:  $0.67 \pm 0.03$ ,  $n = 16$ , after:  $0.78 \pm 0.03$ ,  $n = 20$ ,  $p =$  Figure 8—figure supplement 1. continued on next page
