

Figure 3 – supplement 2. Acinar-ductal reprogramming in 3D culture. (A-B) Brightfield images of acinar-derived ductal cysts from **(A)** *Kras*^{G12D} and **(B)** *Ptf1a* cKO; *Kras*^{G12D} mice, after 3 days of culture in collagen gel. **(C)** Quantification of the maximum diameter of acinar-derived cysts from mice of indicated genotypes (n=3 mice per genotype). For each mouse, >10 randomly selected fields were photographed, and each cyst within the image was measured at its maximum diameter. Scale bars are 400 μm.
