

Fig. 6-figure supplement 1. *RPS5* mutation *E144R* confers a *Gcd⁻* phenotype, derepressing *GCN4-lacZ* expression.

Strains of the indicated *RPS5* genotype from Fig. 3A were transformed with p180 and analyzed for β -galactosidase expression as in Fig. 3B. Mean expression levels and S.E.M.s were calculated from four transformants.
