

Twenty micrograms of total protein from cells co-transfected with 1 µg of a **vector expressing GFP** and 3 µg of the **p97-PROTAC-Ubx-Nb^{GFP} construct (U)**, or 3 µg of an **empty vector (C: control)**, were loaded. The following day, cells were treated with the indicated inhibitors for 4 hours, using DMSO as a control. The experiments were performed in duplicate using independent samples
