

Figure 1 - Supplemental Figure 1 | Conditioned suppression across sessions in female and male rats (Experiment 2).

(A) Mean \pm SEM suppression ratios for Paired (red) and Unpaired (gray) female rats from Experiment 2 are shown for the 2 pre-exposure sessions (p1 & p2), 2 conditioning sessions (c1 & c2), and 1 extinction session (e1). Vertical lines separate session types. (B) Mean \pm SEM suppression ratios are shown for male rats from Experiment 2 with identical formatting. The group \times sex \times session interactions results from female Paired and Unpaired rats crossing over from pre-exposure to conditioning, plus Paired and Unpaired females showing greater differential suppression ratios during extinction. Despite this, both female and male paired rats acquired conditioned suppression to the visual cue.
