

Figure 4. Figure Supplement 1. Effect of order of addition of reaction components on 3-strand recombination reactions in the presence or absence of RadA. Components in the blue box were pre-incubated with buffer and the regenerating system for 8 minutes at 37. Then, reaction components in the green box were added and pre-incubation was continued for 5 minutes. Recombination was initiated by addition of components in the red box. Reactions were then incubated for the times indicated above the gel.
