

**A**

**B**

**Figure 5—figure supplement 3. Protein-protein interaction networks constructed from the cross-links identified in (A) *E. coli* and (B) *C. elegans*.**

The labeling scheme is the same as described in **Figure 5A** except the node color. For *E. coli*, node color is set to orange if the protein was only identified in the whole-cell lysates, to yellow only identified in the ribo-free lysates, or to green if identified in both. There are 626 proteins in the *E. coli* network and 155 proteins in the *C. elegans* network.
