

Figure 2 - figure supplement 1: Cryo-EM imaging of mHtt variants

A. Images of fiber aggregate morphology from each of the mHtt variants by cryo-EM. mHtt fibers were imaged 24h post initiation of aggregation. Scale bar is 500 nm.

B. Morphology of ΔN and $\Delta N\Delta P$ at 60h post initiation of aggregation. Scale bar is 500 nm. Longer incubation for aggregation does not change the fibril morphology and only leads to more aggregates. Scale bar is 500 nm.
