

Figure 1 -- figure supplement 1. *Eed* depletion in WT and *Eed*^{CKO} mice.

Heart apices were harvested for qRT-qPCR for relative *Eed* mRNA expression on postnatal day 0 (P0) and 5 (P5).

Heart apex contains both cardiomyocytes and non-cardiomyocytes. The non-myocytes likely account for the detected level of *Eed* mRNA in EED-CKO. *P*-value by Student's *t*-test. ***, *P* < 0.001. NS, not significant.
