

Figure 3-Supplement 2: Cell cycle progression determined by FACS analysis of DNA content of elutriated early cells of the indicated genotype released in SC-D at 30°C. The peak cell size (in fL) and the budding index are given for each time point. BI, Budding index. The red arrow indicates when half of cells have budded. Elutriations were done three to six times independently for each strain; one example is shown (corresponding to Figure 3A-C). Strain number is indicated atop each histogram.
