

Figure 6 Supplement 3

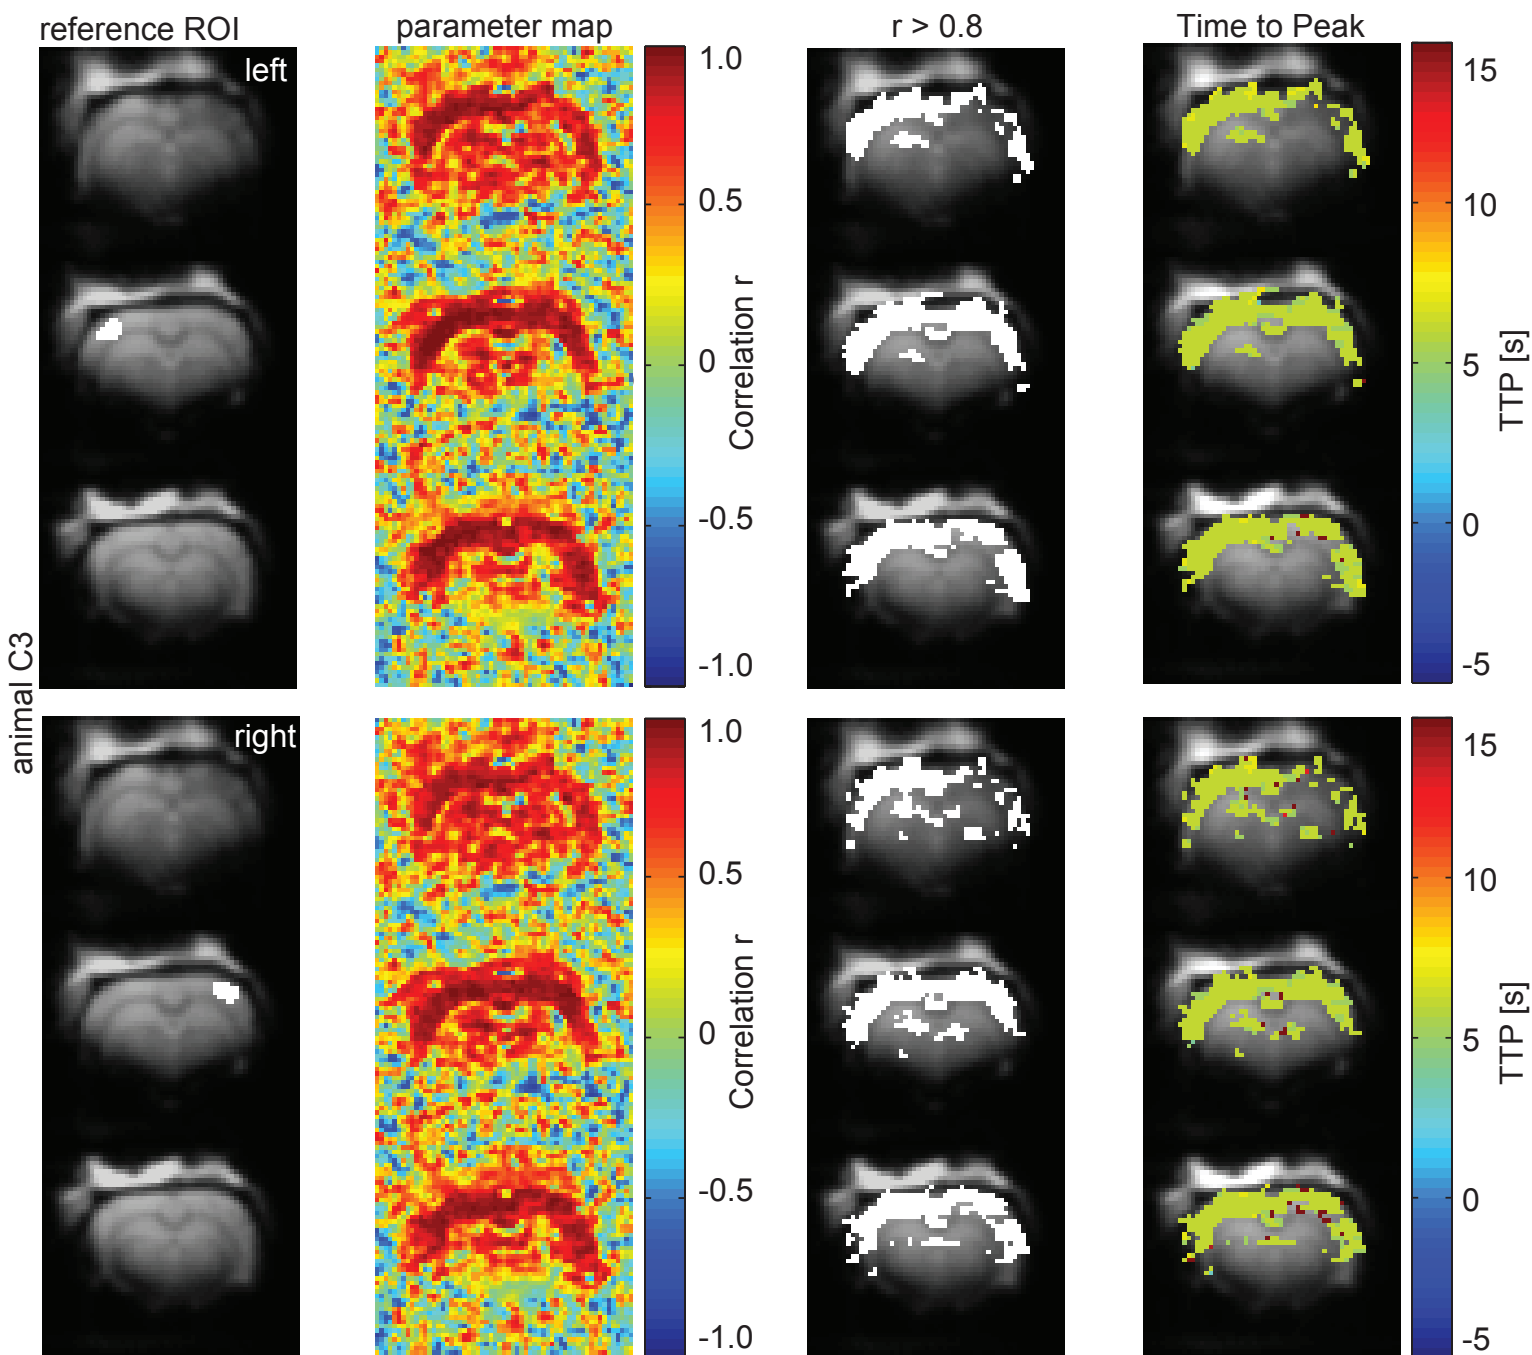

Figure 6 Supplement 3. Calcium recordings-informed correlation analysis reveals pan-cortical BOLD activation during slow wave activity. ROIs on both hemispheres (ipsi- and contralateral sites of the fiber recordings), parameter maps showing r -values and regions of highest correlation ($r > 0.8$; white). The mean HR was calculated from these thresholded regions and time to peak of voxel-by-voxel HR was determined (same analysis as in main Figure 6 C, D in different animal).
