

Figure 4 - Supplementary 1 NANDY

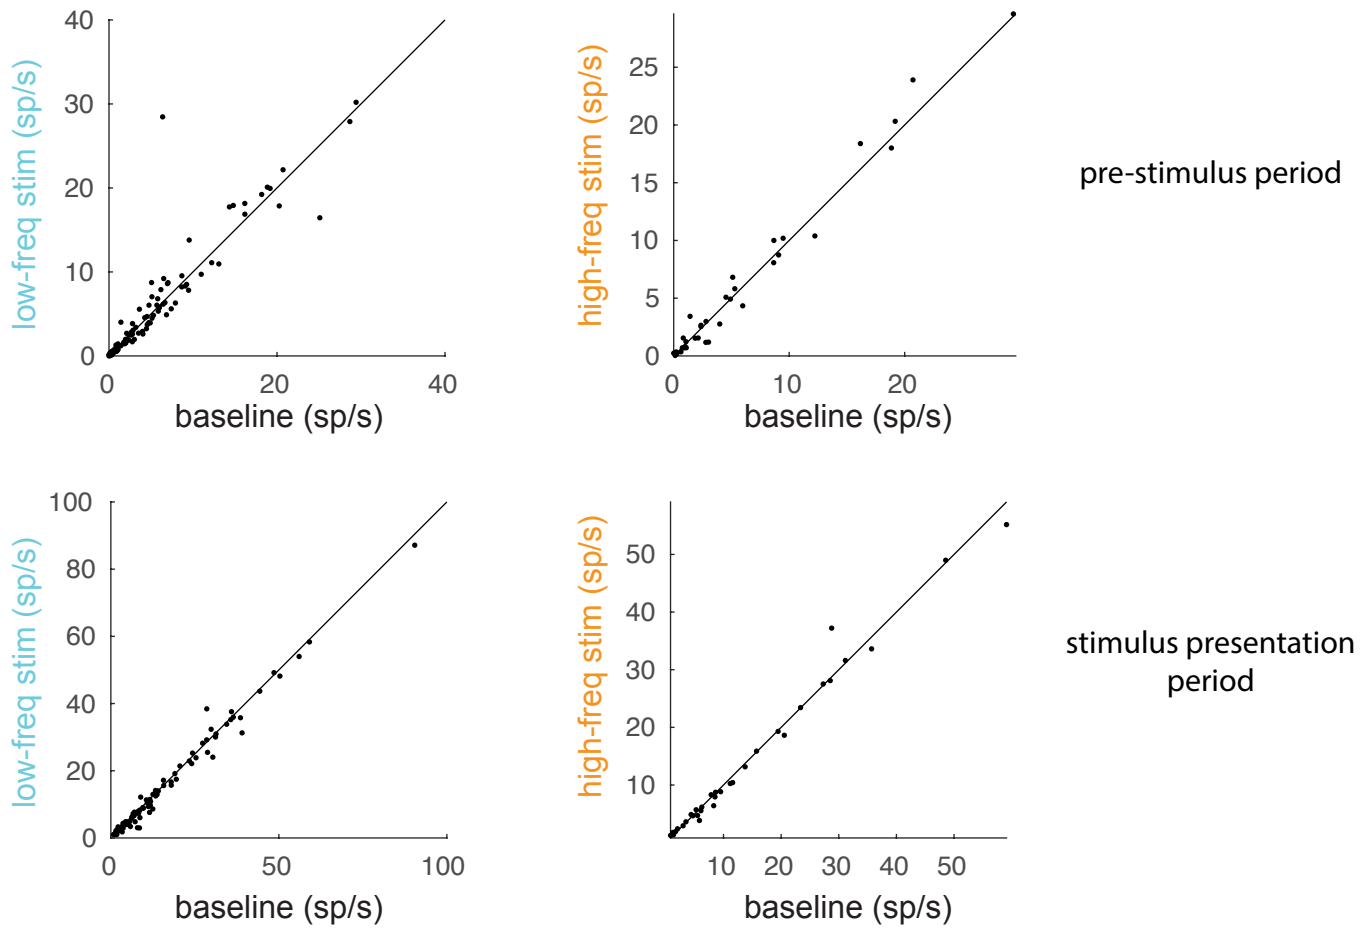

Fig 4 - Supp 1. Comparison of spike rates between optical stimulation and baseline conditions.

Comparison of spike rates between the optical stimulation conditions (low-frequency: left panels; high-frequency: right panels) and the baseline condition for a 200ms pre-stimulus period (top panels) and 200ms stimulus presentation period (60-260ms after stimulus onset; bottom panels). Each dot represents a unit in the population of recorded units.
