

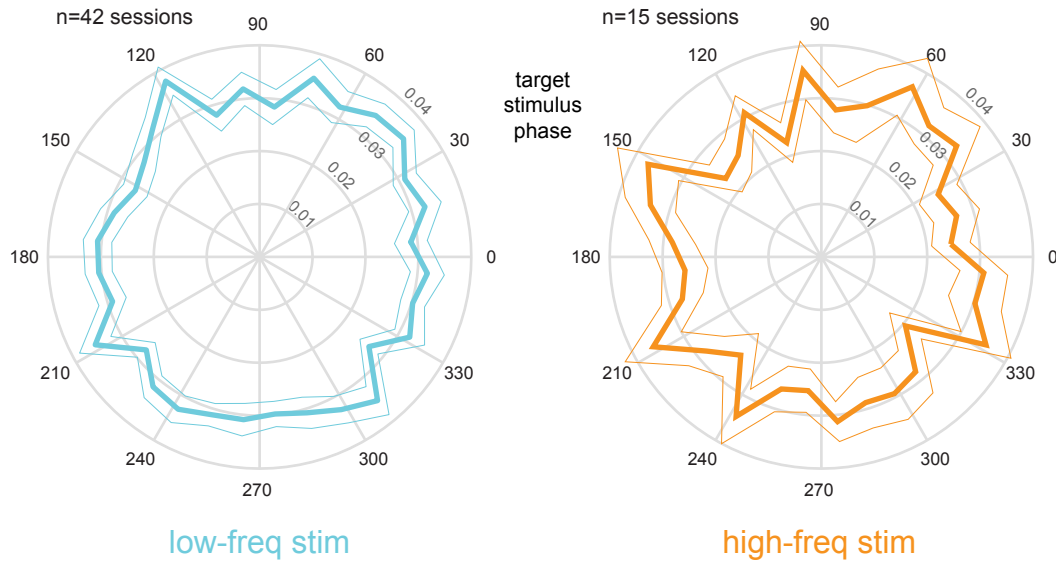

Figure 4 - Supplementary 3 NANDY

A

B

Fig 4 - Supp 3. Behavioral performance is not affected by optical stimulation phase. (A) Phase plots showing the distribution of target stimulus onset times with respect to the phase of the low-frequency (5Hz, left) and high-frequency (20Hz, right) optical stimulation. Mean \pm s.e.m. (B) Normalized performance (pooled across all behavioral sessions) as a function of target stimulus phase. The target stimulus onset times with respect to the phase of the low-frequency stimulation is binned into 4 phase bins (legend). The panels show two different bin arrangements.
