

Figure 4 data

p_n_k.dat = ratio $[ATP]/[ADP]$ (first column) and corresponding probability (second column) for the state with $n=k$ chaperones bound ($k = 0, 1, 2, \dots, 6$). Continuous curves in the figure.

Mean_N.dat = ratio $[ATP]/[ADP]$ (first column) mean number of chaperones (second column). Black dashed curve in the figure.
