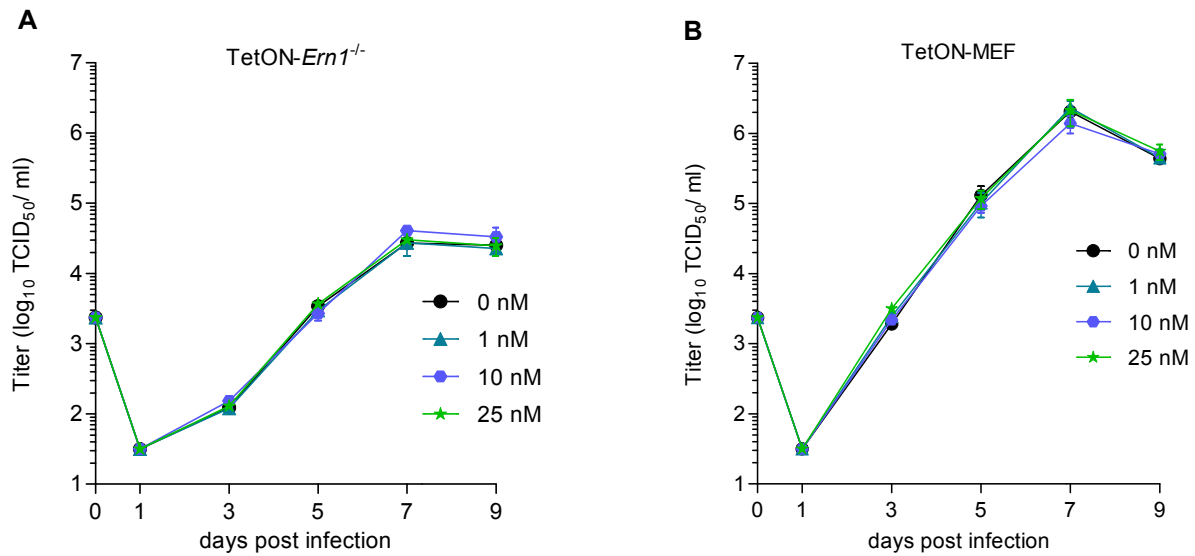

Figure 2—figure supplement 1.

MCMV replication kinetics on TetON expressing cells

- A. Multistep MCMV replication kinetics on TetON-*Ern1*^{-/-} MEFs induced with different doxycycline concentrations. 24 h after induction, cells were infected with MCMV-GFP (MOI 0.1). Virus titers in the supernatants were determined by titration and are shown as means \pm SEM of 3 biological replicates.
- B. Multistep MCMV replication kinetics on WT MEFs transduced with a TetON-expressing lentiviral vector. 24 h after doxycycline treatment, cells were infected with MCMV-GFP (MOI 0.1). Virus titers in the supernatants were determined as above.
