qRT-PCR analysis of viral transcripts in WT and IRE1-deficient cells

A-D. WT and *Ern1* ko MEFs were infected with MCMV-GFP (MOI 0.1). Cells were harvested at the indicated times, total RNA was extracted, and IE1 (M123), E1 (M112), M37, and gB (M55) transcripts were quantified by qRT-PCR. Transcript levels were normalized to *Ern1* ko cells at day 1 post infection (means \pm SEM of 3 biological replicates).

Data provided in Figure 3—source data 1.
