

Figure 2–figure supplement 1: Pairwise pulldowns of Cch2 operon proteins: untagged controls. In each experiment (performed as those shown in Figure 2b), two proteins were co-expressed with each other. Cleared E. coli lysates were applied to Nickel-sepharose beads and flow-through (F/T) fractions were collected. Proteins were eluted with imidazole (E) and all samples were analysed on SDS-PAGE.
