

Figure 4 - figure supplement 1

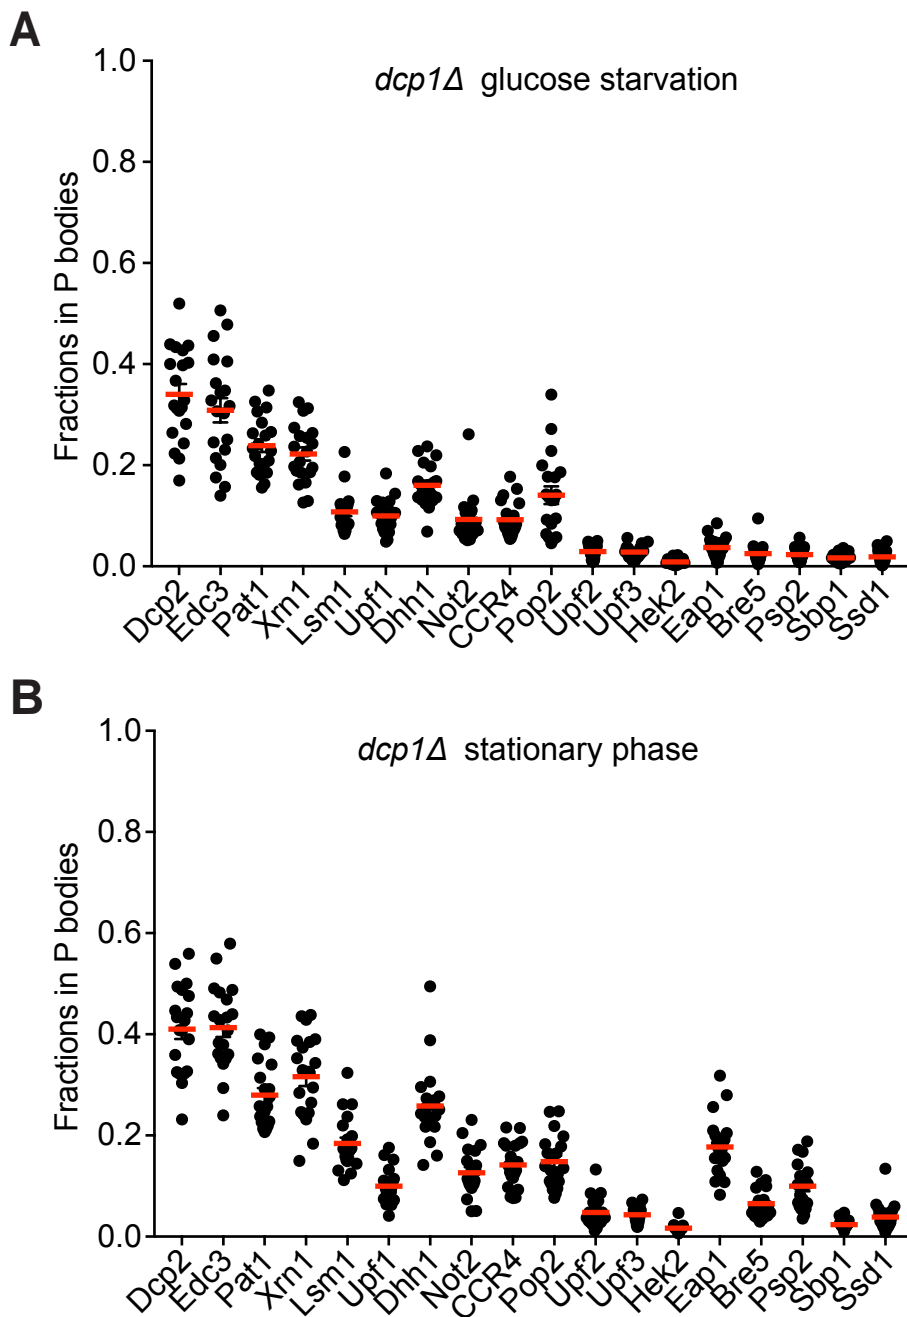

Figure 4 – figure supplement 1. P bodies do not strongly sequester their resident proteins.

(A) Fractions of total protein localized to P bodies (black dots) and mean values (red lines) \pm SEM in *dcp1Δ* strains. Cells were grown to mid-log phase followed by 4h glucose starvation.

(B) Fractions of total protein localized to P bodies (black dots) and mean values (red lines) \pm SEM in *dcp1Δ* strains in stationary phase. In A and B, each dot corresponds to an individual cell, and 20 cells were analyzed for each protein.
