

**Figure 7-figure supplement 1. Best fits of  $^2\text{H}$  enrichment in B-cell subsets in autoHSCT patients.** Best fits of the model (see material and methods) to the enrichment data in naive, Ig class-switched memory and IgM<sup>+</sup> memory B-cells in the 6 autoHSCT patients (A to F). Measured enrichments are shown by black dots. Label enrichment in the DNA was scaled between 0 and 100% by normalizing for the maximum enrichment in granulocytes (see material and methods). The end of  $^2\text{H}_2\text{O}$  administration is marked by a dashed vertical line. Best fits of  $^2\text{H}$  enrichment of the corresponding subsets in healthy individuals were previously published by Westera *et al.* 2015 <sup>24</sup>.
