

Figure 3 – figure supplement 1. Invading cells do not produce curli matrix. (A) Representative image of invading cells (yellow) attached to resident biofilm (red) 3 hours following the conclusion of the invasion. Invading cells encode 6xHis labeled curli monomers. No matrix was detectable by immunostaining (some noise from anti-His antibody background is visible as white/cyan dots in these images). (B) Representative image of invading cells ten hours after invasion. Again, invaders were not producing curli matrix.
