

Figure 3 – figure supplement 2. Quantification of invasion success of *E. coli* lacking the CsgB baseplate required for curli polymerization, with phage exposure post-invasion. (A) Average invading biomass per 150 x 150 x 15μm (L, W, H) view field. Error bars represent standard error of the mean. Pairwise comparisons were performed with Mann-Whitney Signed Ranks tests with Bonferroni correction (n=7; **** denotes $p < 0.00005$).
