

Figure 3-figure supplement 2. Associations of ART regimen (NNRTI-based vs. PI-based) with the levels of cell-associated HIV unspliced RNA (US RNA) and total HIV DNA in the total pooled cohort. Participants were grouped according to the time of continuous virological suppression: 0-1 years, 2-5 years, 6-9 years, and 10 years or more. Units of measurement are: US RNA: log₁₀ copies/μg total RNA, total DNA: log₁₀ copies/10⁶ PBMC.
