

Figure 5 - figure supplement 1

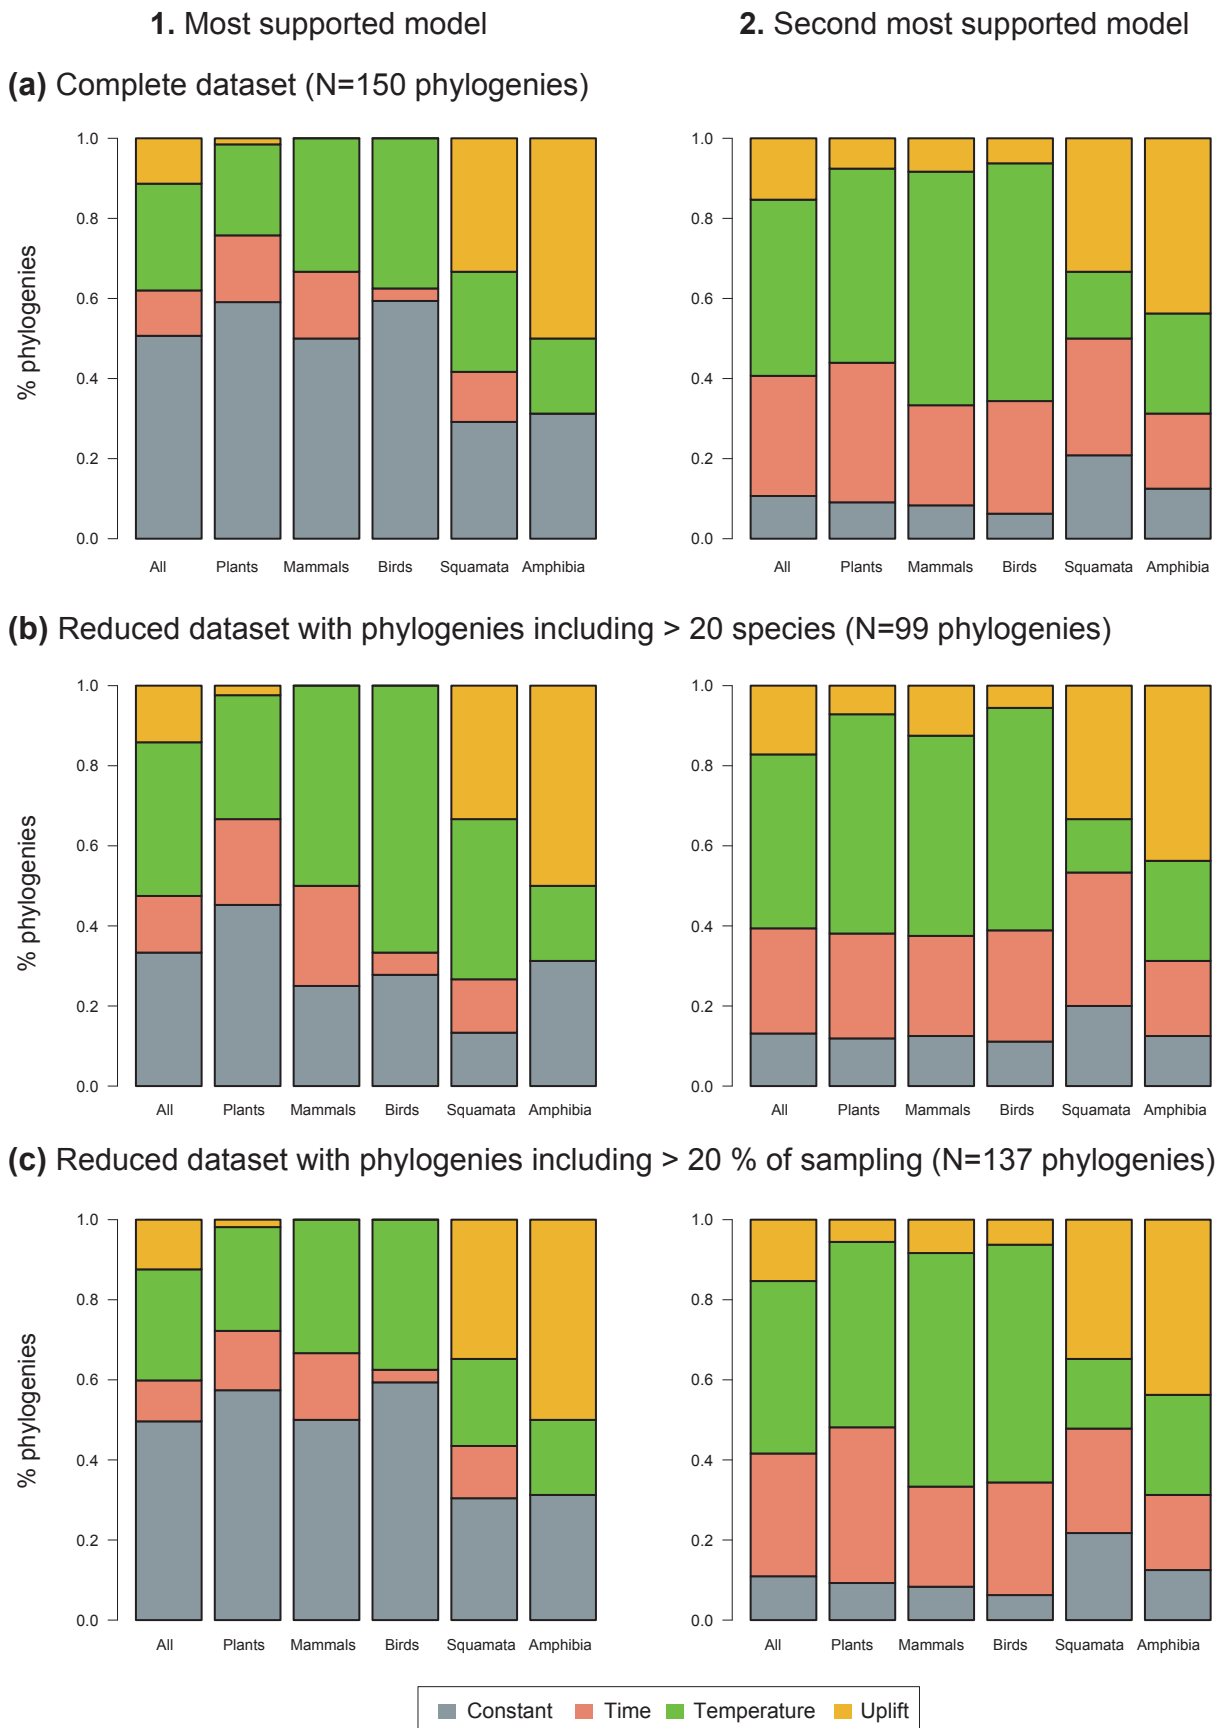

Figure-5 - figure supplement 1. Drivers of Neotropical diversification. The histograms report the proportion of phylogenies whose diversification rates are best explained by a model with constant, time-dependent, temperature-dependent, or uplift-dependent diversification based on **(1)** the most supported model (lowest AIC value), and **(2)** the second most supported model. The results are reported for the complete dataset **(a)**, for a reduced dataset including only trees with more than 20 species **(b)**, and for a reduced dataset including only trees with a sampling fraction over 20% **(c)**.
