

Figure 4 - figure supplement 2. ASV-ASV pairs with two “seasonally varying” partners have slightly higher median correlations across hosts. “Seasonally varying” ASVs were those identified as having seasonally differential CLR abundance in Björk et al. (2022). ASV-ASV pairs with at least one “seasonal” member had significantly higher median correlation across hosts than did pairs where neither partner was seasonal (difference of 0.018, Wilcoxon rank sum test $p = 0.000326$).
