

Figure 5 – figure supplement 1. Interchromosomal contact frequency does not significantly impact recombination efficiency. Survival frequency in the recombination plating assay for interchromosomal strains. Repair allele location is denoted by chromosome and high/low contact frequency with the DSB allele is indicated. Bars represent mean values from at least 3 plating assays per genotype. Error bars represent standard deviation. * $p < .05$, ** $p < .01$, *** $p < .001$, **** $p < .0001$.
