

Figure 5 – figure supplement 2. Rad51 over-expression partially rescues the interchromosomal recombination defect of long-range resection deficient cells. Survival frequency in the plating assay for the interchromosomal strains with the indicated genotypes, plus empty vector (EV) or Rad51 over-expression plasmid (OE). Bars represent mean values from at least 8 plating assays per strain. Error bars represent standard deviation. * $p < .05$, **** $p < .0001$.
